Heuristic Evaluation of a WebSite

4 points out of 20

GOAL

The main objective of this project is the heuristic evaluation of an online platform for an health center.

TASKS

Preparation of a report, which includes:

- ⊗ Identification of at least three situations of good interaction examples.
- ⊗ Identification of key situations constituting bad examples of interaction. For each situation indicate the violated heuristics (we suggest the use of “10 Usability Heuristics” identified by Jakob Nielsen), the degree of severity of the error and the presentation of possible solutions.
- ⊗ For the two previous situations, justify the judgments, specifying the concrete reasons that originated them.
- ⊗ All 10 Heuristics should be mentioned and may be included within the set of good examples or infringed situations.
- ⊗ The work is not limited to the first page of the website, and may extend to the number of pages considered suitable, so as to provide the identification of the above situations.

PROCEDURE

A group of 2 students should be formed, each playing the role of a heuristic evaluation expert. Each group must submit a single report where each student produces separate listings for each heuristic, together with the degree of severity, correction proposal and its justification. Later a new report listing the consensus decisions should be presented. The report should follow one of the models commonly used for this purpose, such as the Template for Usability Aspect Report (UAR) (UARTemplate.pdf). Help: <http://guidelines.usability.gov/>

DEADLINE

The report must be delivered through the Moodle platform until the 19th of March.
